ABSTRACT

During the fall of 1974, the Higher Education Panel of the American Council on Education conducted a survey of continuing education opportunities available to professional scientists, engineers, and mathematicians who are employed full-time in industry and government. The survey sought to gain information on the nature and extent of offerings available within the higher education community by which people employed in science fields could increase and update their professional knowledge and skills, whether in their present or related career fields. The survey results offer specific information on the type and number of offerings currently available, approximate enrollments, type of faculty and modes of instruction utilized, and the distribution of such offerings among institutions of higher education. From a total of 215 institutions reporting, 152 (70.7 percent) had appropriate offerings at their institutions. In general, public institutions accounted for about two-thirds of such offerings. Almost all appropriate continuing education activity was concentrated among doctorate-granting institutions. An institution's regular faculty provided the bulk of the institutional staff, although supplemented to a considerable extent by the use of guest speakers. Statistical tables accompany the text. The appendixes include the questionnaire and survey procedures. (Author/PG)

HIGHER EDUCATION PANEL REPORTS, NUMBER 23 AMERICAN COUNCIL ON EDUCATION

APRIL 1975

A Survey Funded by the National Science Foundation, the U.S. Office of Education, and the National Institutes of Health.

AMERICAN COUNCIL ON EDUCATION

Roger W. Heyns, President

The American Council on Education, founded in 1918, is a council of educational organizations and institutions. Its purpose is to advance education and educational methods through comprehensive voluntary and cooperative action on the part of American educational associations, organizations, and institutions.

The Higher Education Panel is a survey research program established by the Council for the purpose of securing policy-related information quickly from representative samples of colleges and universities. Higher Education Panel Reports are designed to expedite communication of the Panel's survey findings to policy-makers in government, in the associations, and in educational institutions across the nation.

The Higher Education Panel's surveys on behalf of the Federal Government are conducted under grant support provided jointly by the National Science Foundation, the National Institutes of Health, and the U.S. Office of Education (NSF Grant GR-99).

A Survey of Continuing Education Opportunities Available to Nonacademic Scientists, Engineers, and Mathematicians

Elaine H. El-Khawas and Joan L. Kinzer

During the fall of 1974, the Higher Education Panel conducted a survey of continuing education opportunities available to professional scientists, engineers, and mathematicians who are employed full-time in industry and government. Conducted at the request of the National Science Foundation, the survey sought to gain baseline information on the nature and extent of offerings available within the higher education community by which people employed in science fields could increase and update their professional knowledge and skills, whether in their present or related career fields. (For convenience, such offerings will be referred to hereafter as "appropriate" or "suitable" offerings.) The survey results offer specific information on the number and type of offerings currently available, approximate enrollments, type of faculty and modes of instruction utilized, and the distribution of such offerings among institutions of higher education.

Nature of the Sur.ey

The survey questionnaire was mailed to 284 colleges and universities, comprising those members of the Higher Education Panel that granted master's or higher degrees in science and engineering fields during 1970-71. Usable responses were received from 215 institutions (or 76 percent). In Part 1 of the questionnaire, institutions were asked whether they had any continuing education offerings suitable for employed professionals in the designated science fields and, if so, how many different types of institutional units (regular graduate or undergraduate programs, continuing education centers, evening schools or extension divisions) presented such offerings. Part 11, requir-

As determined by the 1970-71 Survey of Earned Degrees Conferred (U.S. Office of Education, Washington, D.C.).

ing specific information on the offerings, was to be completed only in terms of the institution's specially constituted continuing education centers, evening schools, or extension divisions. Further information on survey procedures can be found in Appendix A. A copy of the complete questionnaire is provided in Appendix B.

Of the total number of respondents, 63 institutions (29.3 percent) currently provided no offerings appropriate for the continuing education of scientists, engineers, or mathematicians. Fifty of these were private institutions; most did not offer the doctorate degree.

in all, 152 institutions (70.7 percent) reported that they did have continuing education offerings appropriate to the survey's purposes. Of these, 70 percent were public institutions and 87 percent offered a doctorate degree in science and engineering. Tables 1 and 2 show the range of units through which these 152 institutions provided their continuing education offerings.

Data in Tables 3 through 10 are based on responses to Part II of the questionnaire. Institutions provided specific information on the offerings made available within each of their continuing education units, evening schools, and/or extension divisions. In all, 133 institutions² provided information on the offerings of 182 specialized units.

In interpreting the data in Tables 3 through 10, the restricted scope of the survey should be kept in mind. Appropriate offerings, for example, included only those suitable for the continuing education needs of nonacademic scientists, engineers, and mathematicians who already hold baccalaureate degrees. Detailed information was reported only for appropriate offerings

Nineteen of the 152 institutions provided continuing education offerings only as part of their regular programs. In accordance with survey instructions, these institutions did not complete Part II of the questionnaire.

provided within continuing education centers and evening or extension divisions; the tabulations therefore do not include information on offerings made available as part of regular graduate or undergraduate programs. Furthermore, survey institutions were restricted to colleges and universities that granted master's or higher degrees in sciences and engineering. These restrictions were imposed in an attempt to gain an accurate picture of a defined segment of continuing education.

Overview of Findings

The accompanying tables provide specific information on the nature and extent of opportunities currently available within the higher education community that might be suitable to the continuing education needs of nonacademic scientists, engineers, and mathematicians. As will be noted, counts of institutions and of the number of separate units are frequently provided along with counts of approximate enrollments or total number of offerings. Similarly, most tables include figures on "percent of all respondents"; these figures, based on all 215 respondents to the survey (including 63 with no appropriate offerings) are shown to provide indications of the general extent of continuing education activity for scientists, engineers, and mathematicians currently available within higher education institutions.

Extent of Continuing Education Offerings

A majority of responding institutions (70.7 percent) currently offered continuing education opportunities appropriate to the survey's purpose (Table 1). More than two-thirds were public institutions and 87 percent were doctorategranting institutions.

Type of Unit Offering Continuing Education Opportunities

*Appropriate continuing education opportunities were available within a variety of institutional structures (Table 1). About 37 percent of the

institutions reported that appropriate offerings were available within regular graduate programs.

Appropriate offerings were frequently available within continuing education units, both within general-purpose centers (at 29.8 percent of institutions) and within those with a specific focus (21.4 percent of institutions).

*Continuing education opportunities were more widely available at public than at private institutions.

Among public institutions, regular graduate programs provided appropriate offerings at 40.3 percent of these institutions (Table 1). General-purpose continuing education centers were mentioned almost as frequently (37 percent). Specific-focus centers (e.g., continuing engineering education) were mentioned by 22.7 percent of public institutions. Uniquely for public institutions, 40 percent indicated that appropriate offerings were available as part of extension programs.

Among private institutions, more than half reported that they had no appropriate offerings (Table 1). Of the others, most included continuing education opportunities as part of regular graduate or undergraduate programs. Only a few provided such opportunities through continuing education centers or evening programs.

Total Number of Units With Appropriate Offerings

*Appropriate continuing education offerings were available within a total of 755 separate institutional units (Table 2). Two-thirds of these, however, were regular program units. A total of 144 continuing education centers were reported to have appropriate offerings, 65 of which had specific-focus programs.

Public institutions accounted for two-thirds of all units reported. Among private institutions, a total of 49 continuing education centers were reported, 28 with specific programs.

*Only a small proportion of institutions reported having more than one unit of a given type.

Multiple units were most frequently reported for regular program units. Of institutions with continuing education offerings within regular graduate or undergraduate units, more than half reported having two or more such units with appropriate offerings.

These figures must be interpreted cautiously because some institutions counted their entire graduate or undergraduate program as one unit while others provided a count of the number of separate divisions or schools.

?`

A pattern of one unit per institution was typical for continuing education centers, extension divisions, and evening schools. However, a third of institutions with specific-focus continuing education centers reported having two or more such units.

Total Offerings by Type and Discipline

For the 182 specially constituted units reported by 133 institutions, detailed information was obtained on the approximate number of offerings by type and discipline (Tables 3 and 4). In all, institutional estimates added to about 17,500 offerings (Table 3). Two-thirds of this total were reported by public institutions. Fully 94 percent of the total were offered by Ph.D.-granting institutions.

The great majority of offerings (67.5 percent) were available as courses of conventional length, following a term, quarter, or academic-year format.

About one-fifth of all offerings were available as part of conferences, institutes, or special seminars. This was a rather prevalent institutional practice: fully as many institutions reported use of the conference format (n=105) as had reported use of conventional academic course structures (n=102).

Of all appropriate offerings currently available at responding institutions, the most prevalent discipline category offered was engineering. Notably, almost all of the 5,800 engineering offerings were reported by Ph.D.-granting institutions. Two-thirds of the total were available at public institutions (Table 4).

Courses in social, physical and life sciences were also frequently available. Offerings in these three disciplines, which together totalled 6,300, were heavily concentrated within public and Ph.D.-granting institutions.

in contrast, a total of only 924 courses offering instruction in management skills for scientists and/or engineers were available at 61 institutions (or 28.4 percent of all respondents). About two-thirds of these offerings were reported by public institutions; they were offered almost exclusively by institutions granting the doctorate in science and engineering.

Approximate Enrollments During 1973-74

Based on approximate figures provided by institutions, estimated total

Because of differing rates of response to particular items, the figure for total number of offerings differs among tables 3, 4, and 6. The figure shown here is the highest reported estimate.

enrollment for appropriate continuing education offerings was 403,600. Eighty percent of this enrollment was in public institutions; fully 97 percent of the total enrollment was reported by Ph.D.-granting institutions (Table 5).

The three disciplines reporting the largest enrollment estimates included engineering (132,300), life sciences (80,900), and social sciences (65,800). The lowest enrollment figure was reported for computer sciences (15,600).

Within each discipline, the pattern of most enrollment taking place at public and Ph.D.-granting institutions generally prevailed. Slight exceptions occurred with computer sciences and mathematics, for which about half and a third of total enrollment, respectively, was reported by private institutions.

Location of Offerings

*Of the total number of offerings available in special units of survey institutions, 80 percent were offered directly on the college or university campus. In all, campus offerings of relevance to the continuing education needs of employed scientists, engineers, and mathematicians were available at 59.1 percent of all responding institutions (Table 6).

Of other possible locations, use of the facilities of another educational institution (e.g., community college, high school) was reported by 20.9 percent of institutions. Similarly, courses held in industrial plants or offices were reported by 21.4 percent of institutions. For both types of settings however, only a small number of offerings were available.

Gourses located within federal, state or local government offices were available to only a small extent, accounting for 479 offerings in all.

Modes of instruction

The most frequently utilized modes of instruction for continuing education offerings were classroom lectures, discussion groups, and laboratory work.

Each of these techniques was reported in use by more than 100 of the 133 institutions providing information on their continuing education offerings (Table 7).

Other instructional modes mentioned by 50 or more institutions included use of movies and self-study, as well as use of videotape (62 institutions) and computer-assisted instruction (57 institutions). Use of audio-tape was reported by 44 institutions.

This is a count of enrollments, not of persons. Thus, one person enrolled in three separate courses during the year would be counted three times. Furthermore, all persons enrolled in the offerings, not just nonacademic scientists and engineers, were reported.

٠.

Number and Type of Instructional Staff

*The total instructional staff for appropriate continuing education offerings was estimated at 19,100. Of this total, just over half were regular faculty members at the institution (Table 8).

Guest speakers were frequently utilized for continuing education offerings. An estimated 4,800 speakers, or one-quarter of the total, were part of the instructional staff for these offerings during 1973-74.

institutions estimated that a total of 2,800 adjunct faculty were utilized for continuing education offerings during the year. Notably, adjunct faculty were reported relatively more often by private institutions (where they represented one in five staff members) than by public institutions (with a representation of about one in eight).

Policy on Credit for Advanced Degrees

"Of the 133 institutions providing specific information, close to half indicated that their continuing education offerings were <u>not</u> creditable toward an advanced degree (Table 9).

*In all, 74 institutions reported that continuing education offerings were creditable toward an advanced degree. For 50 of these institutions, the highest degree for which credit could be earned was the master's degree; credit toward a doctorate degree was available at only 24 institutions.

Length of Time Appropriate Offerings Have Bean Available

*Among the institutions reporting, continuing education offerings appropriate to the needs of employed scientists, engineers or mathematicians have typically been available for ten years or more (Table 10).

This situation was noted particularly for evening or extension divisions. Host general-purpose continuing education centers also have had appropriate offerings available for ten or more years, although a good number have had such offerings for shorter periods of time.

As a group, continuing education programs with a specific focus reported the most varied pattern for course availability. Although close to half have offered appropriate courses for at least ten years, more than a third have provided such offerings for five to ten years and another one-fifth have had appropriate offerings only in the last five years.

Conclusion

This survey documents the existence of a broad range of opportunities available within higher education institutions that are suitable for the continuing education needs of employed scientists, engineers, and mathematicians. From a total of 215 institutions reporting, 152 (70.7 percent) had appropriate offerings at their institution. In general, public institutions accounted for about two-thirds of such offerings. Almost all appropriate continuing education activity was concentrated among doctorate-granting institutions. In addition to offerings of separately organized continuing education units, regular graduate or undergraduate programs were a frequent setting in which appropriate offerings were made available.

of the 133 institutions providing specific information on 182 continuing education centers, evening or extension units, a total of approximately 17,500 course offerings -- with an estimated total enrollment of about 403,600 and an instructional staff of about 19,000 -- had been offered during 1973-74. The greatest number of offerings and the largest enrollments were reported for engineering; specialized offerings in computer sciences or in management for scientists and engineers were much less frequently available.

Appropriate offerings were located mainly within public institutions, typically right on the campus rather than in other locations, and for the most part followed the conventional academic model in terms of modes of instruction and calendar format. An institution's regular faculty provided the bulk of the instructional staff, although supplemented to a considerable extent by the use of guest speakers.

Appendi. A
Survey Procedures

Survey Procedures

This survey was conducted as part of the continuing research program of the Higher Education Panel, a survey mechanism established at the American Council on Education in 1971 for the purpose of conducting small-scale surveys on higher education topics of current policy interest. The Panel is based on a network of campus representatives at 644 institutions broadly representative of all colleges and universities in the United States. For a given survey, all member institutions or an appropriate subset might be selected for study.

Because of the varied nature of continuing education activity and because little previous information on particular offerings was available, a pretest was conducted among 20 institutions. For twelve of these institutions, the doctorate was their highest degree offering, while three others had the master's as their highest offering, and five offered no degree beyond the baccalaureate.

The eighteen institutions that replied by the time of the pretest deadline offered many extremely helpful suggestions and comments on the draft question-naire. In particular, pretest institutions pointed out the difficulties of reporting detailed information about those offerings that were available as part of their regular graduate or undergraduate programs. As a result, the final survey requested detailed information only for special units (continuing education centers, evening divisions, etc.). On Part I of the final questionnaire, however, it was still possible to gather information on the total number and range of settings within institutions where appropriate continuing education offerings were available.

Because none of the five pretest institutions with a baccalaureate as their highest degree reported any continuing education activity appropriate to the survey's purposes, it was also decided that the final survey would be limited to those who offered at least a master's degree in science and engineering. In fact, as the survey results have shown, most appropriate offerings appear to be concentrated among doctorate-granting institutions.

Among the 644 members of the Higher Education Panel, there were 284 institutions that fit the criterion of offering a master's or higher degree in science and engineering. Questionnaires were sent to these institutions during September and October, 1974. Of these institutions, 70 percent were Ph.D.-granting, and 55 percent were public institutions.

Completed survey questionnaires were received from 215 institutions (76 percent). Three-quarters were doctorate-granting and 55 percent were public institutions, proportions roughly paralleling those for the entire set of survey institutions. In interpreting the data, however, it should be remembered that respondents were somewhat more likely to be doctorate-granting than were survey institutions in general.

Data shown in the report tabulations represent aggregated totals (unweighted) of the results given by institutions. Most tabulations report data separately for public and private institutions and for those institutions offering the doctorate in science and engineering and those offering a master's as their highest degree offering in these fields. Most of the analysis has focused on the number of institutions responding to the survey; in general, tabulations also show the number of separate units on which the data are based.

OMB No. 99-R0265. Exp. 6/75

SURVEY OF CONTINUING EDUCATION OPPORTUNITIES

AVAILABLE TO SCIENTISTS, ENGINEERS, AND MATHEMATICIANS

Part I - Institutional Form

The purpose of this survey is to gain information about continuing education opportunities suitable for professional scientists, engineers, mathematicians, technicians and/or technologists who are employed full-time in industry and government. More specifically, we hope to: (a) gain a sense of the range of opportunities available to these employed professionals at a sample of colleges and universities and (b) obtain some descriptive information about offerings available through units designed for continuing education purposes. (Please refer to Part II for a description of types of offerings and fields of interest.)

Continuing education opportunities, for the purpose of this survey, refer to any offerings suitable for increasing and updating the professional knowledge and/or skills of employed scientists, engineers, mathematicians, and/or technicians who already hold at least a bachelor's degree (or the equivalent).

Appropriate offerings may or may not result in degree credits or certificates and may include conferences, workshops, symposia, etc., as well as formal courses. Specifically excluded for the purposes of this survey, however, are offerings designed primarily for practicing physicians, other health professionals, elementary and secondary school teachers, or college and university faculty.

For	r your institution as a whole, please complete the following information:			
1.	Does your institution have any offerings appropriate for the continuing education of professional scientists, engineers, and/or mathematicians?			
	Yes No (If no, please skip to Question #3 .	and return this form)		
2.	Please indicate how many of the following types of units, divisions, or centers offer such opportunities (For example, regular graduate units3; evening divisions1.)
